How much does a microgrid controller cost?

The analysis shows that controller cost data as a percentage of total microgrid costs are relatively similar among the projects in our database and the NY Prize data despite the wide variety of system sizes, types, and uses. Controller costs per megawatt range from \$3,500/MW to nearly \$600,000/MW, excluding outliers, with a mean of \$85,000/MW.

What is a microgrid controller?

Your microgrid controller is the brain for your microgrid-- the piece of technology that transforms a collection of disparate microgrid energy resources into a cohesive independent power grid.

How much does a microgrid cost per megawatt?

The analysis of total microgrid costs per megawatt shows that the community microgrid market has the lowest mean, at \$2.1 million/MW of DERs installed; followed by the utility and campus markets, which have mean costs of \$2.6 million/MW and \$3.3 million/MW, respectively. Finally, the commercial market has the highest average cost, at \$4 million/MW.

What is a microgrid cost model?

The U.S. Department of Energy commissioned the National Renewable Energy Laboratory to complete a microgrid cost study and develop a microgrid cost model. The goal is to elucidate the variables that have the highest impact on costs as well as potential areas for cost reduction. This study consists of two phases.

How much new generation is needed for microgrids?

The winners of the Stage 1 competition called for an average of 64% new generation, which is slightly less than the average of 71% new generation for microgrids in the community segment in the NREL cost database.

How much does energy storage cost a microgrid?

In commercial/industrial and utility microgrids, soft costs (43% and 24%, respectively) represent significant portion of the total costs per megawatt. Finally, energy storage contributes significantly to the total cost of commercial and community microgrids, which have percentages of 25% and 15%, respectively, of the total costs per megawatt.
