How to store a lithium battery?

When it comes to storing lithium batteries, taking the right precautions is crucial to maintain their performance and prolong their lifespan. One important consideration is the storage state of charge. It is recommended to store lithium batteries at around 50% state of charge to prevent capacity loss over time.

What temperature should a lithium battery be stored?

The ideal temperature range for lithium batteries is typically between 20°C and 25°C (68°F and 77°F). Avoid storing them in areas where the temperature can drop below freezing point. 5. Use Proper Packaging: If you're storing loose lithium batteries, place them in a secure and non-conductive container or individual battery storage cases.

How long do lithium ion batteries last?

Lithium-ion batteries can last from 300-15,000 full cycles. Partial discharges and recharges can extend battery life. Some equipment may require full discharge, but manufacturers usually use battery chemistries designed for high drain rates. How does storage/operating temperature impact lithium batteries?

What is the ideal charge level for storing lithium batteries?

The ideal charge level for storing lithium batteries is around 40-50% of their capacity. Storing a lithium-ion battery at full charge puts stress on its components, potentially leading to a faster loss of capacity over time. Conversely, allowing a battery to discharge completely before storage can cause irreversible damage.

Should lithium batteries be stored outdoors?

On the other hand, if outdoor storage is inevitable, store your lithium batteries in insulated, waterproof enclosures. This approach avoids damage from moisture buildup, extreme temperatures, and high humidity. When storing the batteries outdoors during winter, use additional insulation to ensure they don't get too cold.

Do lithium batteries need to be discharged before storage?

Discharge as Recommended: Depending on the specific type of lithium battery, the recommended discharge level before storage may vary. Some batteries, such as lithium polymer (LiPo) batteries, should be stored at a partially discharged state (around 40-60% of capacity) to maintain their health during long periods of inactivity.
