What is a potassium ion battery?

A potassium-ion battery or K-ion battery (abbreviated as KIB) is a type of battery and analogue to lithium-ion batteries, using potassium ions for charge transfer instead of lithium ions. It was invented by the Iranian/American chemist Ali Eftekhari (President of the American Nano Society) in 2004.

Are potassium ion batteries a viable alternative to lithium-ion batteries?

Potassium-ion batteries (KIBs) are emerging as a promising alternative technology to lithium-ion batteries (LIBs) due to their significantly reduced dependency on critical minerals. KIBs may also present an opportunity for superior fast-charging compared to LIBs, with significantly faster K-ion electrolyte transport properties already demonstrated.

What is the world's first potassium-ion battery?

Texas-based startup Group1 has unveiled the world's first Potassium-ion battery (KIB) in the industry-standard 18650 cylindrical form factor. This groundbreaking innovation marks a significant milestone in the quest for sustainable and cost-effective alternatives to traditional lithium-ion batteries.

Are solid-state batteries based on potassium & sodium silicate a good choice?

Unlike lithium solid-state batteries, solid-state batteries based on potassium and sodium silicates have a low TRL (Technology Readiness Level). This means there is still a long way to go from discovery in the lab to getting the technology out into society and making a difference.

Could potassium silicate-based solid-state batteries revolutionize EV battery technology?

DTU's innovative research on potassium silicate-based solid-state batteries heralds a potential paradigm shift in EV battery technology, offering a more sustainable and efficient alternative to lithium-ion batteries. This breakthrough could overcome many of the environmental and logistical challenges associated with current battery technologies.

Which carbonaceous materials are used for potassium ion batteries?

Other types of carbonaceous materials besides graphite have been employed as anode material for potassium-ion battery, such as expanded graphite, carbon nanotubes, carbon nanofibers and also nitrogen or phosphorus-doped carbon materials.

By rational electrolyte design, highly reversible low-temperature potassium storage in graphite anode has been achieved for the first time. The as-prepared graphite-based potassium-ion full ...

This potassium battery can be tapped by opening AKT2-like potassium channels and then enables the ATP-independent energization of other transport processes, such as the reloading of sucrose. Insights into these mechanisms have only been possible by combining wetlab and dry-lab experiments by means of computational cell biology modeling and ...

A breakthrough in material science could help deliver a new generation of affordable batteries, scientists say. An international team of researchers led by chemists from the University of Glasgow and battery testing experts at Helmholtz Institute Ulm have implemented a material made from chromium and selenium in a potassium-ion battery.

The exploration of potassium metal batteries (PMBs) has been intensified, leveraging potassium's abundant availability, low redox potential, and small Stokes radius. Covalent triazine frameworks (CTFs) stand out for their accessible nitrogen sites and customizable structures, making them attractive electrode materials. Nonetheless, there is a lack of established design principles to ...

A potassium ion battery or a potassium ion battery is similar to a lithium ion battery, that uses a potassium ion instead of a lithium ion battery to transfer the charge. The unique 2D bi-structure of the multilayer synthesized ultra-thin bismuthene nanosheets is designed to effectively increase the electrode/electrolyte contact area, improve ...

Potassium ion batteries with microparticulate electrodes promise a high volumetric capacity, yet they suffer from poor rate capacity and cyclic stability due to the long K^+ -diffusion path and structural collapse upon K^+ insertion/de-insertion. In this work, a local-expanded MoSSe material with wave structure is successfully constructed in a microparticulate state (labeled as LE ...

The battery's architecture includes Group1's core product, potassium Prussian white cathode, notable for its low cost and high theoretical capacity. Iron-based Prussian white is regarded as an excellent cathode material for KIBs due to its three-dimensional open framework, high potassium content, and affordability.

A lithium-ion battery works by moving lithium ions through an electrolyte liquid from the cathode (made of a mix of metals including lithium and cobalt) to the anode (made from graphite). Lithium-ion and potassium-ion ...
