Microgrid Development Policy

What drives microgrid development?

Resilience, efficiency, sustainability, flexibility, security, and reliability are key drivers for microgrid developments. These factors motivate the need for integrated models and tools for microgrid planning, design, and operations at higher and higher levels of complexity.

What policies have been implemented to promote the development and adoption of microgrids?

Several countries have implemented policies to promote the development and adoption of microgrids. In the United States, the Federal Energy Regulatory Commission (FERC) has implemented Order-2222, establishing rules enabling microgrids to participate in wholesale energy markets.

Are microgrid policies related to distributed energy policies?

Many studies exist on microgrid technologies and operation, but few studies on policies, incentives and barriers to microgrid promotion and deployment. It is to be understood that microgrid policies are unavoidably related to distributed energy polices and precisely renewable energy.

What factors drive microgrid development and deployment?

The factors driving microgrid development and deployment in locations with existing electrical grid infrastructure fall into three broad categories: Energy Security, Economic Benefits, and Clean Energy Integration, as described in Table 2, below. Table 2. Drivers of microgrid development and deployment.

What is microgrid development research?

Another critical area of microgrid development research is using artificial intelligence (AI) and machine learning (ML) techniques to optimize the operation of microgrid systems. AI and ML can analyze large amounts of energy consumption and production data and identify patterns and trends that can help optimize microgrid systems' operation.

Should microgrids be implemented?

Another important consideration for the implementation of microgrids is the issue of social equity. Access to reliable and affordable energy is critical in many communities. Microgrids can solve this problem by providing a more localized and community-based approach to energy access.
