A solar cell functions similarly to a junction diode, but its construction differs slightly from typical p-n junction diodes. A very thin layer of p-type semiconductor is grown on a relatively thicker n-type semiconductor. We then apply a few finer electrodes on the top of the p-type semiconductor layer. These electrodes do not obstruct light to reach the thin p-type layer.

"TDK"s solar cells are flexible amorphous silicon photovoltaic (PV) cells on a film substrate. Generating efficiency is high in low-light environments such as indoors illuminated by fluorescents or LED lights, and they have a well-established track record in the market. They are lightweight and thin, which makes them strong against drops, and are characterized by flexibility for ...
