

Photovoltaic panel voltage doubler rectifier circuit

What is a voltage doubler rectifier circuit?

The usage of a voltage doubler rectifier circuit is observed in the fourth stage of the secondary converter of the transformer. By doubling the voltage in a rectifier circuit, the boost capability of the transformer can be increased and the transformer turn ratio can be reduced.

What is a PRI & doubler rectifier?

In the proposed work, a chain of power electronic convertersusing the PRI and doubler rectifier act as the interface between the solar photovoltaic source and the battery. The PRI produces an A.C. link in which the source side D.C. voltage is converted into an A.C. voltage with a frequency of 12 kHz, and the voltage level is stepped up.

What are the different types of rectifiers?

The system incorporates three types of rectifiers: a voltage-doubler rectifier (VDR), a voltage-tripler rectifier (VTR), and a voltage fifth-folder rectifier (VFR). These rectifiers can be switched automatically depending on the input voltage, resulting in a significant increase in voltage and a reduction in voltage stress on the components.

How resonant AC link & doubler rectifier improve the performance of the system?

The system has exhibited the expected voltage achieved through the resonant A.C. link and the doubler rectifier. The proposed advantages have been achieved and verified in both simulations and experimental verification. Further the performance of the system could be improved with advanced reconfigurable development boards.

Does a reconfigurable rectifier LLC converter work for PV microinverters?

Experimental Results An experimental prototype with a power output of 250 W has been created to verify the functioning and efficiency of the reconfigurable rectifier LLC converter for PV microinverters designed for high DC bus applications. Table 1 provides a concise overview of the primary specifications and design parameters.

How does a reconfigurable rectifier-based LLC converter work?

The reconfigurable rectifier-based LLC converter adjusts the rectifier structure by selectively activating and deactivating and in response to variations in the input, with the goal of maintaining a stable output voltage of 500 V.
