

What does the Seychelles government do?

The Seychelles Government is committed to providing adequate, reliable and affordable energy to meet future energy consumption needs and to underpin strong economic growth through consumable energy initiatives. The Seychelles enjoy favourable conditions for renewable energy (RE) resources, such as wind and solar.

Where can I find information about energy in Seychelles?

Find relevant data on energy production, total primary energy supply, electricity consumption and CO₂ emissions for Seychelles on IndexMundi Homepage. Find relevant information for Seychelles on energy access (access to electricity, access to clean cooking, renewable energy and energy efficiency) on the Tracking SDG7 homepage.

How is electricity produced in Seychelles?

Electricity for the island nation of Seychelles is primarily produced by diesel generators which must import their fuel (69 MW on Mahe and 12 MW on Praslin). Energy policy calls for 15% renewables by 2030. In June 2013, the first wind farm in Seychelles was officially inaugurated.

What is Seychelles' energy policy?

Energy policy calls for 15% renewables by 2030. In June 2013, the first wind farm in Seychelles was officially inaugurated. This 6 MW power plant can produce up to 2% of the Seychelles' power and is located on Mahé Island. It is expected that the wind farm will replace 1.6 million litres of diesel fuel annually.

What is the 'baseline scenario' for energy in Seychelles?

So far, the "baseline scenario" for energy in Seychelles is of slow, incremental addition of RE production, that will likely meet the modest 5% RE by 2020 but will struggle to meet the 15% by 2030 target without substantial changes to overcome technical, institutional, regulatory and financial barriers.

How much does Seychelles contribute to global emissions?

With approximately 0.003% of the world's GHG emissions in 2011, Seychelles contributes only marginally to the global emissions on an absolute scale (GoS, 2015). However, in particular the energy sector is carbon intensive. About 90% of all domestic CO₂ emissions stem from power generation and the road transportation sector.
