Can software tools be used for valuing energy storage?

Taking advantages of the knowledge established in the academic literature and the expertise from the field, there are efforts from multiple parties (e.g., national laboratories, utilities, and system integrators) in developing software tools that can be used for valuing energy storage.

Why is energy storage valuation important?

net positive benefit that meets the return on investment criteria, no further analysis is required. Therefore, as the application space for ESSs grows, energy storage valuation is of a particular interest of many energy storage stake holders (e.g., ESS owners, system operators, regulators, and researchers).

Are optimization methods used in evaluating energy storage technical and economic benefits?

IEEE Access. 2018;6:13231-60. The paper presents a comprehensive review of the applications of energy storage as well as the optimization methods used in evaluating energy storage technical and economic benefits. Many of the software tools for energy storage valuation and design are based on the optimization methods reviewed in this paper.

What are ESS valuation tools?

In ESS valuation tools, the optimizations are usually for finding the charge and discharge schedule of an ESS to maximize its revenue from providing certain services given its energy and power ratings and its round-trip efficiency.

How does cost analysis affect energy storage deployment?

While all deployment decisions ultimately come down to some sort of benefitto cost analysis, different tools and algorithms are used to size and place energy storage in the grid depending on the application and storage operating characteristics (e.g., round-trip efficiency, life cycle).

Are energy storage systems interoperable?

Furthermore, as the application space of energy storage grows very quickly across the entire grid from generation, transmission, distribution to load, the tools are also required to analyze ESSs' interoperability across different spaces (e.g., ESSs that are located in distribution systems but provide transmission services).

In the Swiss Energy Strategy 2050, the government calls for a step-by-step withdrawal from nuclear energy. In the future, energy supply is to be secured through the development of additional hydropower capacity, the use of new renewable forms of energy and the promotion of energy efficiency.
