

The working principle of wind turbine blades

How does a wind turbine turn mechanical power into electricity?

This mechanical power can be used for specific tasks (such as grinding grain or pumping water) or a generator can convert this mechanical power into electricity. A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade.

How does a turbine blade work?

A turbine blade is similar to a rotating wing. Differences in pressure cause the blades to both bends and rotate. In normal operation, the rounded front portion of the blades is oriented in the direction of rotation and the flat portion faces the wind.

How do turbine rotors work?

Turbines catch the wind's energy with their propeller-like blades, which act much like an airplane wing. When the wind blows, a pocket of low-pressure air forms on one side of the blade. The low-pressure air pocket then pulls the blade toward it, causing the rotor to turn. This is called lift.

Why do turbine blades furl?

As the angle of attack increases more surface area is available for aerodynamic forces. Furling of turbine means decreasing the angle of attack. Blades are adjusted in a way that edges are facing towards the wind. It is applicable when there is strong wind and less wind energy is enough to drive the turbine.

What happens when a wind turbine blade rotates?

Assume the flat part of the blade is facing the true wind. As the blade turns, air that flows across the leading edge appears as a separate component of the wind; thus, the apparent wind direction is shifted to oppose the direction of rotation. The rotation of the blade causes a lift force that is perpendicular to the apparent wind direction.

What are the advantages of a single-blade wind turbine?

The advantage of this type of wind turbine is the lower costbecause of the use of only one turbine blade (and the small weight savings),but single-blade turbines must run at much higher speeds to convert the same amount of energy from the wind as two-blade or three-blade turbines with the same size blades.

Horizontal Axis Wind Turbine. We consider HAWT upwind turbines with three blades. This configuration is the most popular commercially. The more the number of blades, the slower the rotor speed. So, turbines with ...

On an airplane wing, the top surface is rounded, while the other surface is relatively flat, which helps direct air flow. The blade on a wind turbine can be thought of as a rotating wing, but the forces are different on a turbine
