

What oil is used for the gearbox accumulator

What is the function of accumulator in a transmission?

The accumulators allow the supply of hydraulic oil to the moving components of the transmission, which are essential for the gear's start - stop function. The accumulator fills with oil while driving, leaving a reserve for when the engine is started, at which time this reserve is returned to the hydraulic system to supply oil to the shift elements.

Where can I find spare parts for a hydraulic transmission accumulator?

If after taking your vehicle to the mechanic they noticed that there is a fault with the transmission accumulator, in the SUN Transmissions online store you will find spare parts for hydraulic transmissions, such as pistons, valves, repair kits and many others that we invite you to discover by browsing the website.

How do accumulators affect the timing of a transmission?

The accumulators modify the changes that affect the timing of the transmission. If there is little pressure in the circuit, that is, little oil, the piston or servo of a clutch could hit, especially when starting the vehicle. As soon as the pressure increases because oil enters the system, the noise goes away and the gear can work normally.

How do you lubricate a compressor gearbox?

Third, to properly flush the gearbox, use one of the new gear lubricants, or a light viscosity of R&O compressor/turbine oil, filling to one-third the recommended operating oil level. Circulate under no-load conditions for 15 minutes and drain. Fig. 3: Maintenance manager taking temperature readings.

Do You need A accumulator in a 6-speed transmission?

In many newer 6- and 8-speed transmissions, "traditional" accumulators and related valves are no longer needed. That's because the computer and solenoids have direct control over the shifts, providing very fine control of shift feel, often in clutch-to-clutch transitions.

Can I use 75W90 gear oil in Selespeed system?

What ever you do, do NOT use 75W90 gear oil in the Selespeed system...!! Fine in the gearbox itself, but not the Selespeed system. For gearbox 75w80 & 75w90 GL4 or GL4+(no GL5). For Seles actuator ATF 9.55550-SA1 like Motul ATF VI, Ravenol GHA-F... The oil spec'd for the TS boxes was GL5. It's why I chose Redline 75W90NS.

The same accumulator and servo piston components are still used on the 4L60-E as on the 4L60, and the same simplified apply chart for the 2-4 band, Forward and 3-4 clutches in Figure 1 can be used. The 4L60 primarily ...
